

AI IN JOURNALISM?

and it's misuse in media articles

Chapter 1. Introduction

The growing use of artificial intelligence in journalism may improve efficiency, it also creates serious concerns regarding misinformation, plagiarism, biased reporting, and the spreading of fake news, making it difficult to distinguish real journalism from automated content.

- Fact-checking tools
- Media literacy programs
- AI detection limits

Chapter 2. Literature Review

Despite these efforts, AI-generated news is becoming harder to detect and may still produce biased or incomplete information.

Chapter 3. Methodology

1. Fact-checking and verification
2. Human editorial review
3. Transparency labeling
4. Media literacy campaigns

Chapter 4. Implementation/Results

The accompanying data on AI-related regulations in the United States from 2016 to 2024 shows a steady overall increase, from very few policies in the early years to a sharp peak of 59 regulations in 2024. Reflecting the growing government concern over AI risks and emphasizes the importance of verification in maintaining trust in digital media.

Chapter 5. Conclusion

The introduction of AI marks a profound shift in the journalistic world. As evidenced by the sharp rise in federal regulations, relying solely on AI detection tools is insufficient to combat these risks. Yet ultimately, preserving trust in digital media requires a strict human-centric framework to separate authentic reporting from automated production.
